

# TABLE OF CONTENTS

Chapter 1: Physics Education: the Physics of Education in Education of Physics	
Introduction	1
Overview of the Dissertation	2
Part I: Modeling Student Learning of Physics	
Chapter 2 : Student Models of Physics	
Introduction	6
Some Current Theories on Learning	6
Our Model of Conceptual Learning	10
Context Dependence of Learning	11
Measurement of Mental Elements	12
Definition of Student Models	13
Dynamics of Student Models	14
Physical Models	14
Student Model State	15
Random Process in Model Triggering	16
The Data Model for Measuring Student Model State	16
Mathematical Framework	18
The Model Space	18
Error Analysis in Measuring Student Model State	19
Examples on Student Models of Introductory Physics	22
The Force – Motion Relation	22
The Newton’s Third Law	25
Overview of the Examples	27
Summary	28
Chapter 3: Model Analysis Algorithms I: The Concentration Factor	
Introduction	31
Model Condition Evaluation – the Concentration Factor	31
The Formulation of the Concentration Factor	32
The Derivation	34
The Application	35
Using Concentration Factor to Evaluate Student Model Condition	35
Concentration of the Incorrect Responses	40
Analysis with FCI Data	41
Initial State	42
The S-C Plot Analysis	43
The S- $\Gamma$ Analysis	45
Applications of Concentration Factor	50
Facilitate Test Development	50
Facilitate Instruction and Evaluation	51
Implications on Test Design	51
Summary	52

Chapter 4: Model Analysis Algorithms II: Model Estimation	
Introduction	54
Identifying the Physical Models	57
Modeling Responses of a Single Student	60
Error Analysis on Item-Based Modeling(IbM)	60
The Implications for Question Design	64
Student Model Density Matrix	66
Creating the Single Student Model Density Matrix	66
Creating the Class Model Density Matrix	67
The Meaning of Model Density Matrix and Student Model States	69
Student Class Model States	73
Evaluating and Presenting Student Model States	75
Application Example	82
Comparison with Factor Analysis	86
The Special Features of Model Analysis	88
Summary	94
Chapter 5: Refinements and Extensions	
Introduction	97
Application with Student Models of Mechanical Waves: an example on multiple-choice multiple-response test	97
Application with FMCE Test	100
Concentration Analysis of FMCE Data	100
Model Evaluation of FMCE Test	104
Modeling with Combined Pattern Analysis on Newton III Questions	106
The Formulation of the Combined Pattern Analysis (CPA)	108
Modeling Student Responses with CPA	108
Analysis of FMCE Questions with Newton III	109
Comparison of Student Performance on FCI and FMCE Test	114
Evaluation of Multiple-Choice Diagnostic Instruments	116
Model Triggering Properties	116
Model Hopping: A differential evaluation of model triggering features	116
Model Triggering Probability	122
Model Triggering Consistency	124
Structures of Student Models	126
Physical Features	126
Examples of Physical Features and Current Instruments	126
A New Multiple-Choice Instrument with Isolated Physical Features	128
Mathematical Modeling and Algorithms	129
Microstate Model Evaluation	129
Macrostate Model Evaluation	130
Microstate Model Consistency	130
Analysis Results	131
Student Model Evolution	134

Implications on Instrument Design	136
Model Measurement with Multiple-choice Questions	136
Resolution of Model Measurement	136
Fine Structure of Models: Isolation of physical features	136
Context Settings of Questions	137
The Cyclic Process to Develop Model-Based Diagnostic Instrument	137
Summary	138
Part II: Student Models of Quantum Mechanics	
Chapter 6: Model-Based Research on Student Difficulties with Quantum Mechanics	
Introduction	140
Overview of Previous Researches	141
Research Environment	141
The Model of This Research	142
Outline of This Research	145
Content Analysis: Important Issues in Learning Quantum Mechanics	145
Probe and Identify Student Models	148
Develop New Instructions and Instruments	150
Summary	151
Chapter 7: Student Difficulties with Classical Pre-Requisites	
Introduction	154
Student Difficulties Indicated from General Observations	154
Probing Student Difficulties	155
Results	158
Tendency to Interpret 1-D Potential Well as a 2-D Gravitational Well	158
Insufficient Background Knowledge about Probability	160
New Instructions to Help Students on Classical Pre-requisites	160
Potential Energy Diagrams	160
Probability Function	161
Evaluations of the New Instruction	162
Improvement on Understanding of Potential Well and Probability	162
Continuing Difficulties	164
Summary of Student Difficulties on Important Classical Concepts	168
Chapter 8: Student Mental Models of Quantum Mechanics	
Introduction	170
Probing Student Understanding on Quantum Concepts	170
The Results	174
Overview of Student Difficulties	174
Identifying Student Models of Quantum Mechanics	178
Summary of Student Models of Quantum Mechanics	184
Quantum Concept Test	184
Models on Quantum Probability and Barrier	184
The Student Model States	185

The Quantum Tutorials	187
Classical Probability	187
Energy Band	188
Summary	190
Chapter 9: Summary and Speculations	
Key Elements in the New Theory	192
Student Models	192
Physical Models	192
Student Model State	192
Random Process in Model Triggering	193
Model Space	193
Model Analysis	194
Application Examples	196
Speculations on Modeling the Learning Process	199
A Crucial Problem on Precise Modeling of Student Understanding	199
The Available Methods	199
Advantages of Model Analysis	200
Appendices	202
Appendix A: FCI and FMCE test	202
Appendix B: Supplemental Calculations and Simulations for the Concentration Factor	216
Appendix C: Supplemental Calculations for Model Evaluations and A New Multiple-Choice Instrument on Newton III with Isolated Physical Features	225
Appendix D: Questions to Probe the Student Understandings on Classical Pre-requisites of Quantum Mechanics	236
Appendix E: Quantum Tutorials	241
Bibliography	257
